In the Claims:

Please cancel claims 1 to 9 without prejudice and add claims 10 to 17:

Claims 1 to 9 (canceled).

10(new). An optical lens (1) having an optically active surface (5') and an optical axis (O), wherein said optically active surface is provided with an embossed fine structure (2), said fine structure (2) extends radially outward in a direction from said optical axis toward an outer periphery (P), said fine structure (2) has an undulating form and wherein an embossed microstructure (3) is provided on the embossed fine structure (2).

11(new). The optical lens as defined in claim 10, wherein the fine structure (2) has a roughness in a range of from 1 μm to 10 μm.

12(new). The optical lens as defined in claim 11, wherein the microstructure (3) has a roughness (h) in a range of from 0.1 μm to 2.5 μm.

13(new). The optical lens as defined in claim 10, 11 or 12, wherein the microstructure (3) is arranged concentrically about said optical axis (O) of the lens (1).

14(new). The optical lens as defined in claim 10, 11 or 12, wherein the embossed fine structure (2) and the embossed microstructure (3) are provided in a surface region (4) extending concentrically about the optical axis (O).

15(new). The optical lens as defined in claim 10, 11 or 12, wherein the embossed fine structure (2) and the embossed microstructure (3) are provided in a surface region (4) extending concentrically about the optical axis (O) and the surface region (4) is on an aspherical side (5) of the lens (1).

16(new). The optical lens as defined in claim 11, wherein said roughness of the embossed fine structure (2) decreases in said direction from said optical axis (O) of the lens toward said outer periphery (P).

17(new). The optical lens as defined in claim 16, in which said roughness of the fine structure (2) of a region oriented toward the optical axis (O) decreases toward another region oriented toward the outer periphery (P).
